Review: Large Language Models

The Language Modeling task is to extend a sequence of words with the likely next word.

$$p(\mathbf{y}_{(t)} \,|\, \mathbf{y}_{(1:t-1)})$$

This process can be repeated, resulting in the generation of complete stories from a short "seed" of a few words.

Language Models are the basis for a great deal of the current revolution in Generative AI.

Language Models: the future (present?) of NLP?

The Language Model objective is a simple NLP training objective.

However, it seems to result in models that have the ability to easily adapt to solve *other* objectives.

This leads to a new paradigm called *Pre-training + Fine-Tuning*

- train a large model, on lots of data, using the Language Model objective
- Fine-tune this model on a small number of examples from a new Target Task

Let's learn about this objective.

<u>Language Models (NLP_Language_Models.ipynb)</u>

Universal API/In-context Learning

Rather than having one model for every task:

• Is it possible to create a single model to solve every task?

Text to text is a "Universal API" <u>Universal API (LLM_Universal_API.ipynb)</u>

In addition to a Large Language Model easily adapting to a new task via Fine-Tuning

- LLM's seem to have the ability to solve new Target tasks
- without further training (Fine-Tuning)
- just by being show instances of examples for the new task at inference time

This is called *In-Context Learning*.

In-Context Learning (In_Context_Learning.ipynb)

Large Language Models (LLM) and Beyond

We give a brief history of the evolution (and rapid growth in size) of Large Language Models.

<u>Large Language Models (NLP_Large_Language_Models.ipynb)</u>

LLM's are powerful but are sensitive to the prompts presented to them.

We briefly introduce the idea of Prompt Engineering.

We then demonstrate how In Context Learning can be used as a "no training" approach to adapting an LLM to solve an unseen task.

- PreTrain_Prompt_Predict (NLP_Beyond_LLM.ipynb)
- From LLM to Bing Search (From GPT to BingSearch.ipynb)
